Galeon

Private payments for public blockchains.

Public accountability without public beneficiary histories.

CARTAGENA ON CHAIN · CARTAGENA, COLOMBIA

Applicant and operator for the funded year. All five members are on this call.

PITCH

Public blockchains make aid auditable, and they make beneficiaries visible.

Galeon keeps settlement public and people private.

Stealth addresses for receiving, a zero-knowledge pool for sending, and a policy gate for accountability. Live on Mantle mainnet today.

Privacy in three layers.

Receiver privacy, transaction privacy, and policy, each with its own control.

01

Ports

A fresh stealth address for every payment.

02

Privacy Pool

A ZK proof breaks the public deposit-to-withdrawal link.

03

ASP

A policy gate decides which deposits may withdraw privately.

LIVE DEMO

galeon.finance ↗ · Entrypoint 0x8633...fb21 ↗

One private withdrawal, performed live: a pre-staged deposit, a client-generated ZK proof, and Mantlescan showing the relayer, not the depositor.

The recipient and amount remain public. We demonstrate unlinkability, not invisibility.

Everything in this demo is open source.

Keys and proofs live in the browser. The backend coordinates but never holds funds. Settlement runs on public smart contracts.

What works today, and what the funded year builds.

WORKS NOW	FUNDED WORK
Stealth-address payments	Stablecoin + blockchain migration
Native-MNT privacy pool	Real ASP process
Relayed private withdrawal	External delta-audit
Public code and licenses	Controlled partner pilot

PROOF BOUNDARY

Galeon proves settlement and contract rules. Partners prove eligibility, receipt, cash-out, and outcomes.

Strong privacy needs an institutional anchor.

Accountable ASP

Rules, review, appeals, and public attestations.

Active deposit set

Meaningful approved participation, not just a pool balance.

Partner delivery

Enrollment, cash-out, support, and safeguarding.

UNICEF can help test all three under real safeguarding constraints.

UNICEF can test whether Galeon belongs in a humanitarian cash program.

Q1	Q2	Q3	Q4
Stablecoin + hardening	Audit + real ASP + sandbox	Controlled pilot	Evaluate + expand

SUSTAINABILITY PATH

Open source · Deploy: integration + training · Operate: support + technical ASP

Institution pays · No beneficiary fee · No current revenue. Funded year tests demand and cost to serve.

See Galeon live.

Everything here is public. Open the app, read the code, verify on chain.

Deposits, ASP roots, withdrawals.

Can public-chain aid stay auditable without a public beneficiary transaction graph? That is what the funded year tests.

Thank you. We are ready for your questions.
