

Galeon

Private payments for public blockchains.

Public accountability without public beneficiary histories.

Open source · Live on Mantle · Built by Mateo Daza and Carlos Quintero

Two founders built Galeon. Five people own the funded work.

BUILT BY

Mateo Daza

Product + frontend

Carlos Quintero

Backend + protocol · Lead developer

Cartagena On Chain is the applicant and proposed funded-period operator.

FUNDED DELIVERY

Fabio Anaya

Growth + partnerships

Juan David Correa

Operations

Juan José Sanfeliú

Marketing + community

Privacy is not one switch.

Galeon separates receiver privacy, transaction privacy, and policy.

01

Ports

A fresh stealth address for every payment.

LIVE

02

Privacy Pool

A ZK proof breaks the public deposit-to-withdrawal link.

LIVE · NATIVE MNT

03

ASP

A policy gate decides which deposits may withdraw privately.

AUTO-APPROVES TODAY

WHAT UNICEF ADDS

Safeguarding gates, realistic usage patterns, and a tested incident response.

LIVE PRODUCT

One private withdrawal, verified live.

Pre-staged deposit

Client-generated ZK proof

Mantlescan shows the relayer, not the depositor

VERIFY IT YOURSELF

Deployed pool · Mantle mainnet

[Entrypoint 0x8633...fb21 ↗](#)

The recipient and amount remain public. We demonstrate unlinkability, not invisibility.

Three layers do the work — all of them public.

Keys and proofs stay in the browser. The backend coordinates but never custodies. Settlement is on public contracts.

01

Client (browser)

Stealth keys — EIP-5564, per-Port isolation

In-browser Groth16 proof (snarkjs)

Spending keys never stored

02

Backend (AdonisJS)

SIWE auth · Ports & receipts

ASP root publisher

Fee-capped relayer — no custody

03

Chain + indexer

Entrypoint · Privacy Pool

Registry · Announcer · 3 verifiers

Ponder indexer → REST API

TRUST BOUNDARY

The backend can see inbound payments; it can never move funds. Spending authority stays client-side.

The live product and public repository match.

537

The product is real. The humanitarian deployment is not finished.

WORKS NOW

Stealth-address payments

Native-MNT privacy pool

Relayed private withdrawal

Public code and licenses

FUNDED WORK

Stablecoin deployment

Real ASP process

External delta-audit

Controlled partner pilot

PROOF BOUNDARY

Galeon proves settlement and contract rules. Partners prove eligibility, receipt, cash-out, and outcomes.

Without an institutional anchor, the privacy model is too weak.

Accountable ASP

Rules, review, appeals, and public attestations.

Active deposit set

Meaningful approved participation, not just a pool balance.

Partner delivery

Enrollment, cash-out, support, and safeguarding.

UNICEF can help test all three under real safeguarding constraints.

UNICEF can test whether Galeon belongs in a humanitarian cash program.

Q1

Stablecoin + hardening

Q2

Audit + real ASP +
sandbox

SUSTAINABILITY PATH

Open source • Deploy: integration + training • Operate: support + technical ASP

Institution pays • No beneficiary fee • No current revenue. Funded year tests demand and cost to serve.
